

Windows Security Monitoring Dashboard using Splunk

Professional Project Report

This report documents the design and implementation of a Splunk Enterprise SIEM dashboard for monitoring Windows Security Event Logs. It demonstrates log analysis, SPL query development, authentication monitoring, and basic threat detection.

Dashboard Overview

Complete Splunk dashboard showing all monitoring panels built using Windows Security Event Logs.

Total Security Events

Displays the total number of Windows Security events indexed by Splunk.

Total Successful Logins

Shows the overall number of successful authentication events (Event ID 4624).

Total Successful Logins

171

Total Failed Logins

Displays the total number of failed authentication events (Event ID 4625).

Total Failed Logins

13

Successful Login Trend

Time-based visualization of successful login activity.

Failed Login Trend

Shows when failed login attempts occurred over time.

Top Login Users

Identifies the accounts generating the highest authentication activity.

Brute Force Detection

Highlights repeated failed logins that may indicate brute-force attempts.

Event Distribution

Distribution of Windows Security Event IDs.

Recent Security Events

Timeline of recently indexed security events.

Conclusion

The dashboard successfully visualizes authentication activity, summarizes Windows Security events, and demonstrates practical SIEM skills. The project covers log ingestion, SPL queries, dashboard creation, and detection of suspicious login behavior, making it suitable for a cybersecurity portfolio targeting SOC Analyst roles.
